Impact Of Military Right To Repair Vote

Currently, the Department of Defense is required to use taxpayer dollars to send any broken or malfunctioning equipment back to the manufacturer for even routine repairs. Servicemembers are contractually prohibited from doing these repairs themselves, even when they are trained and qualified mechanics. If your member of Congress voted against an amendment that allowed qualified servicemembers to repair military equipment in the field, how would that impact your vote for them next time they run for election?

Impact Of Iran War Government Funding Vote

Congress faces a December 11 deadline to fund the federal government, and some members of Congress have publicly opposed passing any new funding without an explicit prohibition on its use for war with Iran. If your member of Congress voted for a government funding bill that allowed funding for the U.S. war against Iran to continue, rather than prohibiting it, how would that impact your vote for them next time they run for election?

Online sample of 1,006 voters fielded from November 18 to November 20, 2026.
Margin of error: +/-3.8%.

YouGov Blue

This survey is based on 1,006 interviews conducted by YouGov on the internet of registered voters. The sample was weighted according to gender, age, race/ethnicity, education, and U.S. Census region based on voter registration lists, the U.S. Census American Community Survey, and the U.S. Census Current Population Survey, as well as 2020 Presidential vote, 2022 Midterm turnout, approximate 2024 Presidential vote based on available results, and party identification estimates based on Pew Research Center's National Public Opinion Reference Survey. Respondents were selected from YouGov to be representative of registered voters. The weights range from 0.15 to 6.04 with a mean of 1 and a standard deviation of 0.69.

The margin of error (a 95% confidence interval) for a sample percentage p based upon the subsetted sample is approximately 3.8%. It is calculated using the formula:

$$\hat{p} \pm 100 \times \sqrt{\frac{1 + \text{CV}^2}{n}}$$

where CV is the coefficient of variation of the sample weights and n is the sample size used to compute the proportion. This is a measure of sampling error (the average of all estimates obtained using the same sample selection and weighting procedures repeatedly). The sample estimate should differ from its expected value by less than margin of error in 95 percent of all samples. It does not reflect non-sampling errors, including potential selection bias in panel participation or in response to a particular survey.
